Preface

Thank you for purchasing this product. The materials available in this Manual (the "Manual") have been prepared by JAVAD GNSS, Inc. ("JAVAD GNSS") for owners of JAVAD GNSS products. It is designed to assist owners with the use of DELTA-3 and its use is subject to these terms and conditions (the "Terms and Conditions").

Please read these Terms and Conditions carefully.

Terms and Conditions

USE – JAVAD GNSS receivers are designed to be used by a professional. The user is expected to have a good knowledge and understanding of the user and safety instructions before operating, inspecting or adjusting. Always wear the required protectors (safety shoes, helmet, etc.) when operating the receiver.

COPYRIGHT – All information contained in this Manual is the intellectual property of, and copyrighted material of JAVAD GNSS. All rights are reserved. You may not use, access, copy, store, display, create derivative works of, sell, modify, publish, distribute, or allow any third party access to, any graphics, content, information or data in this Manual without JAVAD GNSS' express written consent and may only use such information for the care and operation of your DELTA-3. The information and data in this Manual are a valuable asset of JAVAD GNSS and are developed by the expenditure of considerable work, time and money, and are the result of original selection, coordination and arrangement by JAVAD GNSS.

TRADEMARKS – DELTA-3TM, JAVAD GNSS® are trademarks or registered trademarks of JAVAD GNSS. Windows® is a registered trademark of Microsoft Corporation; Bluetooth® word mark is owned by the Blue-

tooth SIG, Inc. Product and company names mentioned herein may be trademarks of their respective owners.

DISCLAIMER OF WARRANTY – EXCEPT FOR ANY WARRANTIES IN THIS MANUAL OR A WAR-RANTY CARD ACCOMPANYING THE PRODUCT, THIS MANUAL AND THE DELTA-3 RECEIVER ARE PROVIDED "AS-IS." THERE ARE NO OTHER WARRANTIES. JAVAD GNSS DISCLAIMS ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR USE OR PURPOSE. JAVAD GNSS AND ITS DISTRIBUTORS SHALL NOT BE LIABLE FOR TECHNICAL OR ED-ITORIAL ERRORS OR OMISSIONS CONTAINED HEREIN; NOR FOR INCIDENTAL OR CONSE-QUENTIAL DAMAGES RESULTING FROM THE FURNISHING, PERFORMANCE OR USE OF THIS MATERIAL OR THE DELTA-3 RECEIVER. SUCH DISCLAIMED DAMAGES INCLUDE BUT ARE NOT LIMITED TO LOSS OF TIME, LOSS OR DE-STRUCTION OF DATA, LOSS OF PROFIT, SAV-INGS OR REVENUE, OR LOSS OF THE PROD-UCT'S USE. IN ADDITION, JAVAD GNSS IS NOT RESPONSIBLE OR LIABLE FOR DAMAGES OR COSTS INCURRED IN CONNECTION WITH OB-TAINING SUBSTITUTE PRODUCTS OR SOFT-WARE, CLAIMS BY OTHERS, INCONVENIENCE, OR ANY OTHER COSTS. IN ANY EVENT, JAVAD GNSS SHALL HAVE NO LIABILITY FOR DAM-AGES OR OTHERWISE TO YOU OR ANY OTHER PERSON OR ENTITY IN EXCESS OF THE PUR-CHASE PRICE FOR DELTA-3.

LICENSE AGREEMENT – Use of any computer programs or software supplied by JAVAD GNSS or downloaded from a JAVAD GNSS website (the "Software") in connection with DELTA-3 constitutes acceptance of these Terms and Conditions in this Manual and an agreement to abide by these Terms and Conditions. The user is granted a personal, non-exclusive, non-transferable license to use such Software under the terms stated herein and in any case only with a single DELTA-3 or single computer. You may not assign or transfer the Software or this license without the express written consent of JAVAD GNSS. This license is effective until terminated. You may terminate the license at any time by destroying the Software and Manual. JAVAD GNSS may terminate the license if you fail to comply with any of the Terms or Conditions. You agree to destroy the Software and manual upon termination of your use of DELTA-3. All ownership, copyright and other intellectual property rights in and to the Software belong to JA-VAD GNSS. If these license terms are not acceptable, return any unused software and manual.

CONFIDENTIALITY - This Manual, its contents and the Software (collectively, the "Confidential Information") are the confidential and proprietary information of JAVAD GNSS. You agree to treat JAVAD GNSS' Confidential Information with a degree of care no less stringent that the degree of care you would use in safeguarding your own most valuable trade secrets. Nothing in this paragraph shall restrict you from disclosing Confidential Information to your employees as may be necessary or appropriate to operate or care for DEL-TA-3. Such employees must also keep the Confidentiality Information confidential. In the event you become legally compelled to disclose any of the Confidential Information, you shall give JAVAD GNSS immediate notice so that it may seek a protective order or other appropriate remedy.

WEBSITE; OTHER STATEMENTS – No statement contained at the JAVAD GNSS website (or any other website) or in any other advertisements or JAVAD GNSS literature or made by an employee or independent contractor of JAVAD GNSS modifies these Terms and Conditions (including the Software license, warranty and limitation of liability).

SAFETY – Improper use of DELTA-3 can lead to injury to persons or property and/or malfunction of the product. The TRIUMPH-1 receiver should only be repaired by authorized JAVAD GNSS warranty service centers. Users should review and heed the safety warnings.

MISCELLANEOUS – The above Terms and Conditions may be amended, modified, superseded, or canceled, at any time by JAVAD GNSS. The above Terms and Conditions will be governed by, and construed in accordance with, the laws of the State of California, without reference to conflict of laws.

Regulatory Information

The following sections provide information on this product's compliance with government regulations.

Screen Captures

This manual includes sample screen captures. Your actual screen can look slightly different from the sample screen due to the receiver you have connected, operating system used and settings you have specified. This is normal and not a cause for concern.

Technical Assistance

If you have a problem and cannot find the information you need in the product documentation, contact your local dealer. Alternatively, request technical support using the JAVAD GNSS World Wide Web site at: www. javad.com

To contact JAVAD GNSS Customer Support use the QUESTIONS button available on the www.javad.com

Description and Operation

Introduction

DELTA-3 is a powerful and reliable receiver for high-precision navigation systems, including high dynamics systems, for machine and traffic control, as well as for high-precision surveying and geodynamics and aerogeophysics applications.

864 GNSS channels of this receiver allow tracking all current and future satellite signals. DELTA-3 is the only receiver in the market that can track and decode the QZSS LEX signal messages.

DELTA-3 can operate as a receiver for post-processing, as a Continuously Operating Reference Station (CORS) or portable base station for Real-time Kinematic (RTK) applications, and as a scientific station collecting information for special studies, such as ionosphere monitoring and the like (Fig. 1).

Figure 1. DELTA-3

DELTA can receive and processes multiple signal types (including GPS C/A, P1, P2, L2C (L+M), L5 (I+Q); Gallileo E1 (B+C), E5A (I+Q), E5B (I+Q), AltBoc, E6; GLONASS C/A, L2C, P1, P2, L3 (I+Q); QZSS C/A, L1C(I+Q), L2C (L+M), L5 (I+Q), SAIF, LEX ; BeiDou B1, B2, B3; SBAS L1, L5 signals) improving the accuracy and reliability of your measuring points and positions, especially under difficult jobsite conditions. The GNSS component of DELTA receivers means you can access the GPS (Global Positioning System) satellites of the United States, the Galileo (an upcoming global positioning system maintained and operated by Galileo Industries), the GLONASS (Global Navigation Satellite System) satellites of the Russian Federation, the QZSS (is a proposed three-satellite regional time transfer system and Satellite Based Augmentation System for the Global Positioning System, that would be receivable within Japan), and the Beidou Compass (Chinese Global Navigation Satellite System), increasing the number of satellites your receiver can detect, thus improving the accuracy of your measuring points, increasing productivity, and reducing cost.

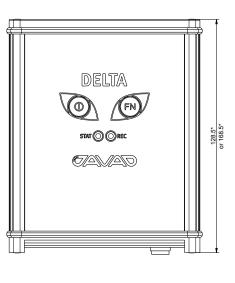

Several other features provide under-canopy and low signal strength reception. The DELTA receiver provides the functionality, accuracy, availability, and integrity needed for fast and easy data collection.

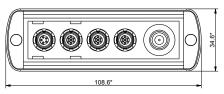

Measuring with the right GNSS receiver can provide users accurate and precise positioning, a requirement for any measuring project. This section gives an overview of existing and proposed Global Navigation Satellite Systems (GNSS) and receiver functions to help you understand and apply basic operating principles, allowing you to get the most out of your receiver.

Specifications

Tracking Specifica	tions
Signals tracked	GPS C/A, P1, P2, L2C (L+M), L5 (I+Q) Gallileo E1 (B+C), E5A (I+Q), E5B (I+Q), AltBoc, E6 GLONASS C/A, L2C, P1, P2, L3 (I+Q) QZSS C/A, L1C(I+Q), L2C (L+M), L5 (I+Q), SAIF, LEX BeiDou B1, B2, B3 SBAS L1, L5
Cold / Warm start/ Reacquisition	<35 seconds/ <5 seconds/<1 second
Performance Spec	ifications
Autonomous	<2 m
Static, Fast Static accuracy	Horizontal: 0.3 cm + 0.1 ppm * base_line_length* Vertical: 0.35 cm + 0.4 ppm * base_line_length*
Kinematic accuracy	Horizontal: 1 cm + 1 ppm * base_line_length Vertical: 1.5 cm + 1.5 ppm * base_line_length
RTK (OTF) accuracy	Horizontal: 1 cm + 1 ppm * base_line_length Vertical: 1.5 cm + 1.5 ppm * base_line_length

DGPS accuracy	< 0.25 m (post-processing) < 0.5 m (real-time)
Real-time heading accuracy	\sim 0.004/L [rad] RMS, where L is the antenna separation in [m]
Power Specification	ons
Battery	External
External Input Voltage	+4.5 to +35 volts (1 external power port)
Power Consumption	8 W
I/O	
GNSS Antenna Connector	50 Ohm TNC, +5 VDC (120 mA) to power LNA.
Communication Ports	Two serial RS232 port (up to 460.8 kbps) Two high-speed RS232/RS422 serial port (up to 460.8 Kbps) High-speed USB 2.0 device port (480 Mbps) Full-duplex 10BASE-T/100BASE-TX Ethernet port CAN 2.0
Other I/O Signals	Two 1 PPS Two Event Markers IRIG A134, A137, B124, B137 External Reference Frequency Input/Output
Status Indicator	Two LEDs, two function keys (TriPad)
Memory and Reco	rding
Internal Memory	Up to 16 GB of on-board non-removable memory for data storage
Raw Data Recording	Up to 100 times per second (100Hz)
Real Time Data	
Input/Output	JPS, RTCM SC104 v. 2.x and 3.x, CMR
Output	NMEA 0183 v. 2.x and 3.0, BINEX
Environmental	
Enclosure	Aluminum extrusion, waterproof IP66
Operating /Storage Temperature	-40° C to +70° C / -45° C to +85° C
Humidity	95%
Dimensions	4.3 x 1.4 x 5.6 / max 6.3 inches (109 x 35 x 141/ max 160 mm) with connectors
Weight	0.92 lbs (0.42 kg)

TriPad

The TriPad is the receiver's minimum interface used to display and control data input and output.

The STAT (status) LED displays the number of tracked satellites.

- Green eight and more satellites.
- Yellow five to seven satellites.
- Red less than five satellites.
- No light no satellites.

Effective number of satellites are total number of satellites tracked minus the number of non-GPS systems tracked. E.g. if 8 GPS and 5 GLONASS are tracked the effective number of satellites is 12.

The REC (record) LED displays the data recording status and blinks on each recording.

- Green recording data.
- Yellow less than 10 min memory left.
- Red memory is full.
- No light not active.

The On/Off (power) button turns the receiver on and off.

The FN button starts/stops data recording.

Data and power ports

The DELTA receiver can be equipped according users needs and have different ports on the front and back panels.

Below are presented some examples of possible configurations:

Figure 4. DELTA Ports

- Power used to connect the receiver to an external power source. This port can also be used to charge the batteries.
- Serial used for communication between the receiver and an external device.
- Ethernet used to connect the receiver to local network.
- USB –used for high-speed data transfer and communication between the receiver and an external device.

The DELTA-3 receiver can be equipped according users need and have different connectors on the back panel. Below are presented some examples of possible configurations:

• The external GNSS antenna connects to the TNC external antenna connector (optional)

- The 1PPS and Event marker BNC connectors (up to two) (optional)
- External Frequency Input/Output BNC connector (optional)

Turning On/Off

To turn ON the receiver, press and hold the power button until the LEDs briefly flash. To turn OFF the receiver, press and hold the power button for more than one and less than four seconds (until both the SAT and the REC LEDs are off). This delay (about 1 second) will prevent the receiver from being turned off by mistake.

DELTA-3 saves the last power status and restore it after voltage loss.

Power supply requirements

The socket-outlet shall be installed near the equipment and shall be easily accessible.

A single external power supply with 5 pin ODU connector or SAE connector is necessary to operate DELTA-3. If external power supply has only SAE connector, Receiver-to-SAE power cable shall be used. The external power supply needs to be Listed for US and Certified for EU countries, it needs also to be a Limited Power Source and have an output rated for 14.5 - 35 V DC, 2A. This may not be the same range as other JAVAD GNSS products with which you are familiar. To avoid the introduction of hazards when operating and installing, before connecting of the equipment to the supply, make sure that the supply meets local and national safety ordinances and matches the equipment's voltage and current requirements.

Warning: Never attempt any maintenance or cleaning of the supply while plugged in. Always remove supply from AC power before attempting service or cleaning.

If the voltage supplied is below the minimum specification, the receiver will suspend operation. If the voltage supplied is above the maximum specification, the receiver may be permanently damaged, voiding your warranty.

Make sure cords are located so that will not be stepped on, tripped over, or otherwise subjected to damage or stress. Do not operate equipment with a damaged cord or plug – replace immediately. To reduce the risk of damage to the equipment, pull by the plug body rather than the output cord when disconnecting the equipment.

Warning: Do not operate the supply if it has received a sharp blow, been dropped, or otherwise damaged. Do not disassemble the supply.

Before connecting the external power source and the receiver, make sure that the power source matches the receiver's voltage and current requirements.

Powering the receiver

To check the status of the internal batteries, view the BAT LED or check the status using JAVAD GNSS software. Check the BAT LED for battery status.

To charge the receiver internal batteries, take the following steps:

• Plug the Receiver-to-SAE cable's connector into the power port of the receiver (14-578125-01).

• Connect the opposite end of this cable with the battery charger'-s SAE connector (22-570101-01).

• Plug the other end of this cable into an AC outlet with cable (14-508053-01). Leave overnight.

Cables

The DELTA-3 receiver package includes standard communication and power cables for configuring the receiver and providing a power source to the receiver.

• Receiver-to-computer RS232 serial cable – connects the receiver's serial port and an external device (hand-held controller or computer) p/n 14-578103-01

• Receiver-to-SAE power cable – connects the receiver's power port and the power supply's SAE connector or the extension cable's SAE connector p/n 14-578101-01

• SAE-to-SAE cable extension – connects SAE connectors over longer distances p/n 14-578102-01

Option Authorization File (OAF)

JAVAD GNSS issues an Option Authorization File (OAF) to enable the specific options that customers purchase. An Option Authorization File allows customers to customize and configure the DELTA-3 receiver according to particular needs, thus only purchasing those options needed.

Typically, all DELTA-3 receivers ship with a tem-

porary OAF that allows the receiver to be used for a predetermined period of time. When the receiver is purchased, a new OAF activates desired, purchased options permanently. Receiver options remain intact when clearing the NVRAM or resetting the receiver.

Managing and Operating Receiver using NetView

This software is available on the JAVAD GNSS website. If downloading the program(s) from the website, extract the program's files into a folder on your hard drive. The following sections describe installing this software, and other sections throughout the manual describe using this software with the receiver.

Note: Refer to the NetView Software Manual for full details on installing and using NetView Software.

1. If downloading the program from the website, extract the program files into a folder on your hard drive.

2. Navigate to the location of the NetView program and double-click the Setup.exe icon.

3. Follow the on-screen installation instructions. Click Install to continue. Keep the default installation location or select a new location. If desired, create a shortcut on the computer's desktop for quick access to NetView.

JAVAD GNSS NetView software provides an interface for various configuration, monitoring, and management functions for the receiver.

Once you have established a connection between the receiver and the computer/controller, you will be able to configure the receiver and its components, send commands to the receiver, download files from the receiver's memory; as well as, upload new firmware, upload an OAF, and upload configuration files to a receiver, using NetView.

Establishing an RS232 Cable Connection

Using the RS232 cable, connect the serial port of your computer (usually COM1) to the receiver's serial port A.

1. Press the power buttons on the receiver and computer to turn them on.

2. Start NetView, select SER as type of connection mode, and specify the port the receiver is connected to.

Connection	Memory Slots:
Receivers	Recall from slot: Slot 1 Slot 2 Slot 3 Slot Save to slot: Slot 1 • Save

Figure 5. NetView: Connection via serial port

Establishing an USB connection

Make sure the computer has JAVAD GNSS's USB driver installed (available from www.javad.com) before continuing.

1. Using the USB cable, connect the USB port on the receiver to a USB port on the computer.

2. Press the power buttons on the receiver and computer to turn them on.

3. Start NetView and select USB as type of connection mode and select USB port ID from the list

Configuring Receiver

Both Base and Rover receivers must be configured according to the desired survey method.

In applications where real-time positioning results are required, the Base receiver provides the correction information needed to properly calculate the location of the Rover receiver. A Base station is normally set up over a known point and collects GPS/GLONASS data from satellites. As the receiver picks up satellite data, it measures the carrier and code phases to accurately compute and verify its location. Then, the receiver transmits this information via radio (UHF or GSM) to the Rover receiver.

The Rover receiver applies correction information from the Base station to its current location to accurately calculate one or more points. Rovers are mobile GNSS receivers on a survey pole or bipod that compares the information from the Base station to the data it logs from satellites and applies correction algorithms to accurately calculate a new point.

In applications intended for post-processing, the receivers typically log code phase and/or carrier phase measurements separately from common satellites and during the same time interval. This data is then processed using post-processing software (for example, Justin).

When configuring receivers for RTK surveying, use the following list to ensure the receivers are properly set up:

Configure one receiver as an RTK Base station and the other receiver as an RTK Rover.

Configure the communication data link for transmitting and receiving corrections.

Set up the Base receiver over a known point to begin collecting static observation data and transmitting corrections. Set up the Rover receiver to begin collecting RTK data.

When configuring receivers for post-processing surveying, use the following list to ensure the receivers are properly set up:

Configure one receiver as a Base station and the other receiver as a Rover.

Set up the Base receiver over a known point to begin collecting static observation data. Set up the Rover receiver to begin collecting static or kinematic observation data. **Note:** Do not make other changes without consulting the Net-View Software Manual.

1. Connect the receiver and computer, start NetView and establish the connection as described above.

2. Click *Receiver* > *Parameters* on the left panel.

3. In the *General* tab check antenna status and set the parameter *Antenna Input* to *External* if the external antenna will be used.

6. To set up the base station, open the *Base* tab and set the following parameters: *Antenna Phase Center Position (APC)* - enter latitude, longitude, and altitude (ellipsoidal height) values of the antenna position. Do

one of the following:

• If known, type in the values.

• Click *Get from receiver* to use the current antenna position.

7. Restart your receiver. Open the *Base* tab and check coordinates. Click *Refresh*, to refresh the parameters.

Reference Position	Ports Networking Event Advanced
Coordinate system: Geodetic ▼ Antenna Phase Center Position (APC) Lat. 55 * 56 * 18.673824 * N ◆ W84 ◆ Lon. 37 * 26 * 43.963171 * E ◆ Att. 190.0385 * Get from receiver APC → ARP L1 to ARP Offsets Height, m: 0 Easting, m: 0 Northing, m: 0	Antenna Reference Point Position (ARP) Lat. 55 ** 56 ** 18.673824 ** N ** W84 ** Lon. 37 ** 26 ** 43.963171 ** E ** Ait. 190.0385 * Apc <- ARP

Figure 11. Base tab

7. To set up the rover, open *Positioning* tab and set the *Position Computation Mode* - this drop-down list box allows selecting the mode of position computation:

• pd -carrier phase differential (RTK) with fixed ambiguities

• pf - carrier phase differential (RTK) with float ambiguities

- cd- code differential (DGPS) mode
- wd wide area code differential mode (WDGPS)
- sp single point positioning mode1

Open the Rover tab and set up the following parameters:

• RTK Computation Position Mode select Extrapolation for RTK float (kinefor matic). or Delay RTK fixed (static). If Extrapolation is selected, the rover will extrapolate the base station's carrier phase measurements when computing the rover's current RTK position. If Delay is selected, the rover will not extrapolate the base station's carrier phase measurements to compute the current rover position. Instead, the RTK engine will compute either a delayed RTK position (for the epoch to which the newly received RTCM/CMR message corresponds) or the current stand-alone position (while waiting for new RTCM/CMR messages coming from the base).

• Confidence Level for Ambiguity – list box governs the process of the RTK engine fixing integer ambiguities. The RTK engine uses the ambiguity fix indicator when making a decision whether to fix ambiguities or not. Low, Medium and High correspond to the indicator's 95%, 99.5% and 99.9% states, respectively. The higher the specified confidence level, the longer the integer ambiguity search time. This is the price one pays for the higher reliability of the ambiguity fixed solution.

11. Click Apply, to save the made changes and settings into receiver's memory and close the dialog window. The receiver configuration will be kept in the receiver till you will change them or will clear NVRAM.

Note: For detailed description of settings and parameters see NetView Software Manual..

TriPad Configuration

The DELTA-3's simple user interface (TriPad) consists of two keys (Power and Record) and two LEDs that control and display the receiver's operation.

Note: Use NetView to configure TriPad settings. Refer to the NetView Software Manual for all possible MinPad configurations.

Connect the receiver and PC as described above. Start NetView. Establish connection with the receiver.

Open *TriPad* tab. Set the following parameters and click *Apply*:

- "File a, File b"
- "Function Key"
- "Automatic File Rotation Mode (AFRM)"

File a, File b

In the fields File a, File b can be specified current log-file name, message output period, etc.

• Current log-file edit box allows the user to specify the prefix of the log file, which will be saved into

receiver memory during survey.

• In the Output Epochs Counter box the number of outputted epochs is shown.

• In the Implicit Message Output Period edit box the output period for the implicit messages can be specified. This parameter specifies the interval of outputting messages into the log-file when data logging is activated with the TriPad or through the AFRM.

• Elevation Mask for Measurements Output (the minimum elevation angle for the satellites whose data will be put in the receiver files logged when pressing FN).

• Satellites Number Mask for Position computation - Satellites with elevations lower than this mask will be excluded from position computation.

• File Name Prefix - this setting specifies what prefix will be added to the names of the receiver files created via MinPad, (i.e., by pressing FN). The prefix can be up to 20 characters long. Default is log.

• Enable Implicit Management of Specific - enables/ disables the management of Implicit Message Output Period.

Function Key

TriPad "FN" Button Action	led	~
Turn Data Recording On at Startup	off	~
Initial Dynamic Mode	static	~
Appending data to a specific file		
Toggle Automatic File Rotation Mode	off	~

Figure 15. Funktion Key

• TriPad "FN" Button Action - This drop-down list box is used to program how the receiver will react to clicking FN (i.e., keeping the button depressed for less than one (1) second). In led blink mode switch mode, clicking FN will toggle between the MinPad's standard and extended information modes. In occupation mode switch you click FN to get the receiver to insert into the corresponding log file a message indicating that the occupation type has been changed from static to kinematic, or vice versa.

• Turn Data Recording on at Startup - enables/disables data recording on at startup,

• Initial Dynamic Mode - specifies the starting occupation type descriptor that will be inserted at the beginning of each receiver files logged via the Min-Pad. You select static and kinematic to specify that the corresponding log file will start with a static and kinematic occupation, respectively. • Appending data to a specific file - If the new receiver data are to be appended to an existing log file, enter the desired filename in the Always append to the file edit box. The setting can be up to twenty characters long.

• Toggle Automatic Rotation Mode - enables/disables Automatic File Rotation Mode.

Automatic File Rotation Mode (AFRM)

File Rotation Running (0			
Force File Rotation		off	~	
File Rotation Mode		off	~	
Enable Oldest Log-file	Removal	off	~	
Scheduling Paramete	ers			
Scheduling Parameter File rotation counter]	
	0]	

Figure 16. AFRM

• Period – specifies the time duration of each of the multiple log files created in AFRM mode.

• Phase – specifies the phase (i.e., constant time shift) of the multiple log files created in AFRM mode.

• Enable Oldest Log-file removal – if active, the receiver will remove the least recent files if no free space is available in the receiver memory to record the current file

Setup and survey

After configuring the receivers for surveying, each receiver needs to be setup up and the receiver's height measured and the survey can begin. The MinPad provides quick access for logging data, changing receiver modes, and viewing general data logging and satellite information during a survey.

A typical GPS survey system consists of a Base station set up over a known point and a Rover receiver set up to be a mobile data collector. After setting up the Base and Rover receivers, the antenna height must be measured.

Before collecting data, make sure the Base and Rover receivers contain a current almanac and current ephemeris data.

The Base station must be set up, logging data, and transmitting data before setting up the Rover receiver. Receiver setup for either post-process or RTK surveys is the same.

Measure Antenna Height

The location of the antenna relative to the point being measured is very important for both surveys in which the elevation of the points is important and in surveys for horizontal location only. Horizontal surveys are often larger in area than can reliably fit on a flat plane, therefore the antenna adjustment must be done in three dimensions and then projected onto a two dimensional plane.

The receiver calculates the coordinates of the antenna's phase center. To determine the coordinates of the station marker, the user must specify the following:

- Measured height of the antenna above the station marker
- Method of measuring the antenna height
- Model of the antenna used

Antennas have two types of measurements:

• Vertical – measured from the marker to the antenna reference point (ARP) located on the bottom of the receiver at the base of the mounting threads.

• Slant – measured from the marker to the lower edge of the antenna slant height measure mark (SHMM) located on both end panels of the receiver.

The point to which surveying with GNSS measures is called the Phase Center of the antenna. This is analogous to the point at which a distance meter measures in a prism. A user must enter the prism offset to compensate for this point not being at a physical surface of the prism. For a GNSS antenna, the offset is entered depending on the type of measurement taken.

For vertical, the offset is simply added to the measured vertical height to produce a "true" vertical height.

For slant height, the vertical height must first be calculated using the radius of the antenna, then the offset can be added.

The offsets are different because of the difference in location between the slant measuring point and the vertical measuring point.

Measure the antenna height above the control point or marker, either the slant height or the vertical height.

Record the antenna height, point name, and start time in the field notes

To start survey DELTA-3 should be set up on a tripod or in a pole.

Collecting data

See the remaining sections in this chapter for more information on collecting data.

- Turn on the receiver.
- Once the receiver has locked on to eight or more satellites the STAT light will green.

• The process of locking on to satellites normally takes less than one minute. In a new area, under heavy tree canopy, or after resetting the receiver, it may take several minutes.

• To begin collecting data, press and hold the FN button (for more than one second and less than five seconds).

• Release the FN button when the REC (recording) LED turns green. This indicates that a file has opened and data collection has started. The REC LED blinks each time data is saved to the internal memory.

• When finished, press and hold the FN button until the REC LED light goes out.

To turn off the receiver, press and hold the power key until all lights go out, then release.

Static Surveying for Base Stations

Static surveying is the classic survey method, well suited for all kinds of baselines (short, medium, long). At least two receiver antennas, plumbed over survey marks, simultaneously collect raw data at each end of a baseline during a certain period of time. These two receivers track four or more common satellites, have a common data logging rate (5–30 seconds), and the same elevation mask angles. The length of the observation sessions can vary from a few minutes to several hours. The optimal observation session length depends on the surveyor's experience as well as the following factors:

- The length of the baseline measured
- The number of satellites in view
- The satellite geometry (DOP)
- The antenna's location
- The ionospheric activity level
- The types of receivers used
- The accuracy requirements

• The necessity of resolving carrier phase ambiguities

Generally, single-frequency receivers are used for baselines whose lengths do not exceed 15 kilometers (9.32 miles). For baselines of 15 kilometers or greater, use dual-frequency receivers. Dual-frequency receivers have two major benefits. First, dual frequency receivers can estimate and remove almost all ionospheric effect from the code and carrier phase measurements, providing much greater accuracy than single-frequency receivers over long baselines or during ionospheric storms. Secondly, dual-frequency receivers need far less observation time to reach the desired accuracy requirement.

After the survey completes, data the receivers collect can be downloaded onto a computer and processed using post-processing software (for example, JAVAD GNSS Justin).

Kinematic (Stop & Go) Surveying for Rover Stations

In a kinematic, stop and go survey, the stationary receiver (Base station) is set up at a known point such as a survey monument, or an unknown point. The receiver continually tracks satellites and logs raw data into its memory. The Rover receiver is set up at an unknown point and collects data in static mode for 2 to 10 minutes. When finished, assign the Rover to kinematic status and move to the next survey point. At this point, and each subsequent point, the receiver is changed to static mode to collect data. So, while moving, the Rover is in kinematic mode, and while collecting data, the Rover is in static mode.

• Set up the Rover at an unknown point and press power. Allow the Rover to collect static data for two to ten minutes. The REC LED will be yellow.

- Check the SAT light for satellites tracked.
- When finished, press the FN button for less than 1 second to assign the Rover to kinematic.
- Move the Rover to the next location (survey point), and press the FN button for less than a second to collect the data in static mode for two to ten minutes.
- Repeat steps five and six until all points have been surveyed. The occupation time for the points depends on the same factors as for the static survey method.

• When finished, press the FN button for one to five seconds to stop logging data. Turn off the Rover if needed. This method of GNSS survey allows the operator to reduce the point occupation time, thus permitting field crews to survey many more points compared to the other methods available.

Real Time Kinematic Surveying

With RTK surveying, as with kinematic surveying described above, one receiver serves as the reference station and conducts observations with its antenna affixed to a stationary tripod or some other device. The other receiver functions as a rover and conducts observations (using an antenna) affixed to a mobile pole and moved to observation points.

Unlike post-processed kinematic surveys, RTK surveys utilize a communications link between the Base and Rover. Using a radio modem link, the Base receiver transmits its measurement and location data to the Rover receiver. The Rover, based on the transmitted data and its own observation data, immediately conducts a baseline analysis and outputs the results.

Usually, the receiver will start to output the coordinates of the antenna's phase center along with the solution type within 10–30 seconds. However, UHF radios and GSM phones may take as long as 60 seconds to synchronize. The geodetic coordinates displayed on the Location tab are always computed in WGS84 and have four solution types.

• Standalone – where the receiver computes 3D coordinates in autonomous mode without using differential corrections.

• Code differential – where the Rover receiver computes the current relative coordinate in differential mode using only pseudo ranges.

• RTK float – where the Rover receiver computes the current relative coordinates in differential mode using both pseudo ranges and phases; however, with a float solution, the phase ambiguity is not a fixed integer number and the "float" estimate is used instead.

• RTK fixed – where the Rover receiver computes current relative coordinates, with ambiguity fixing, in differential mode. The LQ field reflects the status of the received differential messages and contains the following information:

• Data link quality in percentage

• Time (in seconds) elapsed since the last received message

• Total number of received correct messages (dependent on the message type received)

• Total number of received corrupt messages (dependent on the message type received)

• If the receiver is not (for some reason) receiving differential corrections, or if none of the ports has been configured to receive differential corrections, the LQ field will either be empty or it will look like this: 100%(999,0000,0000).

Receiver and File Maintenance

If post-processing the data after completing a measuring, the data in the receiver's memory will need to be downloaded to a computer. Downloading and deleting files will also prepare the receiver's memory for the next measuring. Occasionally, the receiver's NVRAM may need to be cleared to eliminate communication or tracking problems. As project expectations expand, the receiver's OAF may need to be updated to provide expanded operation and functionality. The receiver requires firmware to properly operate and provide appropriate functionality. As JAVAD GNSS releases firmware updates, loading these updates into the receiver will ensure that the receiver operates at its full potential.

Deleting Files and Downloading Files to a Computer

When your measuring finishes, you can download your measuring files to a computer for storage, post-processing, or backup. Also, the DELTA memory holds a finite amount of files and information, so downloading the files to a computer ensures that no files are lost. You should download files as soon as possible after collecting data at the jobsite. NetView provides a File Manager to download files to your computer and delete files from the receiver DELTA.

Connect your receiver and computer. Start NetView. Establish connection between NetView and receiver.

Click File on the left panel. On the right panel appears the list of files, saved in receiver's memory. Select the file(s) to download:

Name	Size	Rec Mod	ified State		-
log0619a	7.65 KB (7836)	6/19/2010	5:23:15 PM		
log0905a	14.57 KB (14921)	9/5/2010 7	:09:26 AM		1

			Download N	Delete	

Figure 17. Downloading files

Click the *Download* button. During the download, status indicators display each file.

To delete files from your receiver click Delete. Click *Yes* at the delete files confirmation dialog box. NetView deletes the selected files.

Managing Receiver Options

Checking an OAF

For a complete list of options and their details, visit the JAVAD GNSS website.

You can check the status of your receiver's options, and load any new OAFs via NetView.

Connect your receiver and computer. Start NetView. Establish connection between NetView and receiver.

Click on the receiver name on the left panel. On the right open Options tab.

- Option name a name/description of the option
- Current shows if the option is in force at the present or not
- Purchased if the option is purchased or not
- Leased if the option is leased or not

• Date – the date the leased option will be disabled, if applicable

Loading OAFs

JAVAD GNSS dealers provide customers with OAF files. For any OAF related questions, E-mail at support@javad.com. Please have your receiver ID number available.

Connect your receiver and computer. Start NetView. Establish connection between NetView and receiver.

Click on the receiver name on the left panel. On the right open Options tab.

To upload a new options file, click on Upload button, and select the options file. Refresh – Updates the window

Navigate to the location of the new Option Authorization File. OAFs have .jpo extension and are unique to each receiver.

Clearing the NVRAM

The receiver's Non-Volatile Random Access Memory (NVRAM) holds data required for satellite tracking, such as almanac and ephemeris data, and receiver position. The NVRAM also keeps the current receiver's settings, such as active antenna input, elevation masks and recording interval, and information about the receiver's internal file system.

Even though clearing the NVRAM is not a common (nor normally a recommended) operation, there are times when clearing the NVRAM can eliminate communication or tracking problems. Clearing the NVRAM in your receiver can be interpreted as a "soft boot" in your computer. After clearing the NVRAM, your receiver will require some time to collect new ephemerides and almanacs (around 15 minutes). Clearing the NVRAM of your receiver will not delete any files already recorded in your DELTA's memory. However, it will reset your receiver settings to factory default values.

In addition, the NVRAM keeps information about the receiver file system. Note that after clearing the NVRAM, the receiver's SAT LED will flash yellow for a few seconds indicating that the receiver is scanning and checking the file system.

Using TriPad to Clear NVRAM

- Press the power button to turn off the receiver.
- Press and hold the FN button.
- Press and hold the power button for about 4 to 8 seconds. Release the power button while continuing to hold the FN button.
- Wait until the four LEDs blink yellow.
- Release the FN button.

Using NetView to Clear NVRAM

- Connect your receiver and computer. Start NetView. Establish connection between NetView and receiver.
- Click on the receiver name on the left panel. On the right click on Actions4Clear NVRAM.
- Confirm NVRAM clearing.

Checking Firmware Version

Use NetView to check the firmware version of your receiver.

- Connect your receiver and computer. Start NetView. Establish connection between NetView and receiver.
- Click on the receiver name on the left panel. On

the right appears the information about receiver including receiver model, ID, firmware version.

To save this information to the .txt file, click Reports4Receiver info on the right panel.

Loading New Firmware

Base and Rover receivers must be loaded with the same firmware version. Use the latest firmware version, available for download from the JAVAD GNSS website, to ensure your receiver has the most recent updates.

To load new firmware use NetView.

- Connect your receiver and computer. Start NetView. Establish connection between NetView and receiver.
- Click on the receiver name on the left panel. On the right appears the information about receiver.
- Click *Action Update* firmware.
- Select the file with the mew firmware and click Open.

Troubleshooting

This chapter will help you diagnose and solve some common problems you may encounter with your receiver.

Warning: Do not attempt to repair equipment yourself. Doing so will void your warranty and may damage the hardware.

Check This First!

Before contacting JAVAD GNSS support, check the following:

Check all external receiver connections carefully to ensure correct and secure connections. Double check for worn or defective cables.

Check all power sources.

Check that the most current software is downloaded onto the computer and that the most current firmware is loaded into the receiver. Check the JAVAD GNSS website for the latest updates.

Then, try the following:

Reset the receiver using NetView: Receiver name (on the left panel)4Actions 4Reset.

Restore default settings using NetView *Receiver* name (on the left panel) ► Actions ► Initial parameters. Clear the NVRAM. If the problem persists, see the following sections for other solutions.

Receiver Problems

The following are some of the most commonly encountered receiver problems.

Cable specific problems

The cable is not properly plugged in.

Check that the cable connector is attached to the correct receiver port.

Unplug the cable, then securely and properly reconnect it to the receiver.

The cable is damaged.

Use an undamaged cable. Contact your Dealer to replace the cable.

Generic problems

The receiver port used for connection is not in Command mode.

Connect your receiver and a computer using a free port and start NetView.

Change the Input for the port used for connection to "Command".

The receiver does not lock on to satellites for a long period of time.

See "Managing Receiver Options" for details on how to check current options.

Order a new OAF with the desired options activated to enable or extend validity of the corresponding receiver options. Contact your dealer or visit the JAVAD GNSS website for details.

Refer to the NetView Software Manual for a detailed description of options.

The receiver tracks too few satellites

The elevation mask value is too high (above 15 degrees).

Lower the elevation mask. See "TriPad Configuration" for information on setting the elevation mask.

The measuring is conducted near obstructions (tree canopy, tall buildings, etc.).

Check that the Multipath Reduction boxes have been enabled.

Connect your receiver and a computer using a free port and start NetView.

Click enable Multipath reduction and click Apply. Move to an area free of obstructions, if applicable. The receiver cannot obtain Code Differential and/or RTK solutions.

Incorrect Base coordinates entered

Specify the correct coordinates for the Base station using NetView or another suitable field data collection software.

The receiver is not configured as a Base or Rover.

If the receiver should function as a Base, ensure it has the proper configuration.

If the receiver should function as a Rover, ensure it has the proper configuration.

The corresponding receiver options may be disabled or expired.

See "Managing Receiver Options" for details on how to check current options.

Order a new OAF with the desired options activated to enable or extend validity of the corresponding receiver options. Contact your dealer or visit the JAVAD GNSS website for details.

Refer to the NetView Software Manual for a detailed description of options.

There are not enough common satellites. In order to obtain a fixed solution, the Base and Rover should track at least five common satellites.

Ensure that both the Rover and Base receivers use the same, and updated, almanac.

Check the elevation masks of the Rover and Base receivers; they should be the same. See "TriPad Configuration" for information on setting the elevation mask.

A discrepancy exists between the differential standards used at the Base and Rover receivers. Ensure the Base and Rover receivers use the same corrections input/output format:

Connect your receiver and a computer and start NetView.

Click and the Ports tab. Use the same input/output format for both receivers.

Poor satellite geometry (PDOP/GDOP values are too high).

Conduct your measuring when PDOP values are low.

The elevation mask is above 15 degrees.

Lower the elevation mask.

The transmitting and/or receiving antenna may be improperly connected.

Check that the radio modem's antenna is securely

and properly connected to the antenna connector.

Check that the radio modem's antenna is undamaged. If damaged, contact your JAVAD GNSS dealer to replace the antenna.

The specified baud rate is incompatible with the baud rates the receiver supports.

The baud rate is the rate at which the receiver transmits differential messages to the receiver and vice versa. Change the baud rate to that which your receiver supports.

The Base and Rover receivers use different radio link parameters.

Configure the Base and Rover radio receivers according to the procedures listed in the applicable section.

The distance between the Base and Rover is too far.

Close the distance between the Base and Rover.

Use repeaters to increase radio coverage.

There may be a source of radio interference that disrupts radio communications.

Change the RF channel (if possible).

Use a spectrum analyzer to detect the radio characteristics of the interfering signal and change your system's configuration accordingly.

Remove the source of jamming signal or relocate your radio antennas (if possible).

The receiver does not start data logging

The memory option is disabled or expired.

Check that the memory option is enabled. For details, see "Checking an OAF".

The receiver's memory has no free space.

Download and/or delete data files to free up space for new files. Use the AFRM feature.

Technical Support

If the troubleshooting hints and tips in this Operator's Manual fail to remedy the problem, contact JAVAD GNSS Support.

Before contacting JAVAD GNSS Customer support about any problems with the receiver, see "Check This First!" for some solutions that may fix the issue.

To contact JAVAD GNSS Customer Support use the QUESTIONS button available on the www.javad.com.

For quick and effective support, provide a detailed description of the problem.

Safety Warnings

Read these instructions.

Keep these instructions.

Heed all warnings.

Follow all instructions.

Clean only with a damp cloth.

Do not block any of the ventilation openings. Install in accordance with the manufacturer's instructions.

Do not install near any heat sources such as radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat.

Protect the power cord from being walked on or pinched particularly at plugs, convenience receptacles, and the point where they exit from the apparatus.

Only use attachments/accessories specified by the manufacturer.

Use only with a pole, cart, stand, or tripod, specified by the manufacturer, or sold with the apparatus. When a cart is used, use caution when moving the cart/apparatus combination to avoid injury from tip-over.

Unplug this apparatus during lightning storms or when unused for long periods of time.

Refer all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as power-supply cord or plug is damaged, liquid has been spilled or objects have fallen into the apparatus, or has been dropped.

Apparatus shall not be exposed to dripping or splashing and no objects filled with liquids, shall be placed on the apparatus.

Storage Precautions

Always clean the instrument after use. Wipe off dust with a cleaning brush, then wipe off dirt with a soft cloth.

Store in a location with a temperature of from -40° to $+85^{\circ}$ C, and no exposure to direct sunlight.

Use a clean cloth, moistened with a neutral detergent or water, to clean the receiver. Never use an abrasive cleaner, ether, thinner benzene, or other solvents.

Always make sure the instrument is completely dry before storing. Dry the receiver with a soft, clean cloth.

General Warnings

JAVAD GNSS receivers are designed for measuring and measuring related uses (that is, measuring coordinates, distances, angles and depths, and recording such measurements). This product should never be used:

- Without the user thoroughly understanding operator's manual.
- After disabling safety systems or altering the product.
- With unauthorized accessories.
- Without proper safeguards at the measuring site.
- Contrary to applicable laws, rules, and regulations.

Warning: The DELTA receiver should never be used in dangerous environments. Use in rain or snow for a limited period is permitted.

A single external power supply with 5 pin ODU connector or SAE connector is necessary to operate DELTA. If external power supply has only SAE connector, Receiver-to-SAE power cable shall be used. The external power supply needs to be Listed for US and Certified for EU countries, it needs also to be a Limited Power Source and have an output rated for 4,5...35 V DC, not less than 2A. This may not be the same range as other JAVAD GNSS products with which you are familiar.

Warning: To reduce the risk of electric shock, do not perform any servicing other than that contained in the operating instructions unless you are qualified to do so.

Warning: To avoid the introduction of hazards when operating and installing, before connecting of the equipment to the supply,

make sure that the supply meets local and national safety ordinances and matches the equipment's voltage and current requirements.

Warning: Never attempt any maintenance or cleaning of the supply while plugged in. Always remove supply from AC power before attempting service or cleaning.

Warning:

Warning: If the voltage supplied is below the minimum specification, the receiver will suspend operation. If the voltage supplied is above the maximum specification, the receiver may be permanently damaged, voiding your warranty.

Warning: Make sure cords are located so that will not be stepped on, tripped over, or otherwise subjected to damage or stress. Do not operate equipment with a damaged cord or plug – replace immediately. To reduce the risk of damage to the equipment, pull by the plug body rather than the output cord when disconnecting the equipment.

Warning: Do not operate the supply if it has received a sharp blow, been dropped, or otherwise damaged. Do not disassemble the supply.

Warning: If you have difficulty inserting the plug, turn it over and reinsert it. If the unit will not the used for a long time, disconnect the plug from the outlet.

Warning: Before connecting the external power source and the receiver, make sure that the power source matches the receiver's voltage and current requirements.

JAVAD GNSS recommends certified External power supply (p/n 22-570101-01/02) available to order on JAVAD GNSS accessories page. It is rated for indoor use.

Before plugging the power cord into an AC outlet, make sure that all the connections have been made.

Usage Warnings

If this product has been dropped, altered, transported or shipped without proper packaging, or otherwise treated without care, erroneous measurements may occur.

Do not connect or disconnect equipment with wet hands, you are at risk of electric shock if you do!

The owner should periodically test this product to ensure it provides accurate measurements. Inform JAVAD GNSS immediately if this product does not function properly.

Only allow authorized JAVAD GNSS warranty service centers to service or repair this product.

Warranty Terms

JAVAD GNSS electronic equipment are guaranteed against defective material and workmanship under normal use and application consistent with this Manual. The equipment is guaranteed for the period indicated, on the warranty card accompanying the product, starting from the date that the product is sold to the original purchaser by JAVAD GNSS' Authorized Dealers.

During the warranty period, JAVAD GNSS will, at its option, repair or replace this product at no additional charge. Repair parts and replacement products will be furnished on an exchange basis and will be either reconditioned or new. This limited warranty does not include service to repair damage to the product resulting from an accident, disaster, misuses, abuse or modification of the product.

Warranty service may be obtained from an authorized JAVAD GNSS warranty service dealer. If this product is delivered by mail, purchaser agrees to insure the product or assume the risk of loss or damage in transit, to prepay shipping charges to the warranty service location and to use the original shipping container or equivalent. A letter should accompany the package furnishing a description of the problem and/or defect.

The purchaser's sole remedy shall be replacement as provided above. In no event shall JAVAD GNSS be liable for any damages or other claim including any claim for lost profits, lost savings or other incidental or consequential damages arising out of the use of, or inability to use, the product.

900 Rock Avenue, San Jose, CA 95131, USA
